Schilling J. Clevinger B., Davie J.M., Hood L.;
"Amino acid sequence of homogeneous antibodies to dextran rearrangements in heavy chain V-region gene segments.";
Nature 283:35-40(1980).

-i- MISCELLANEOUS: THE SEQUENCES OF 10 HYBRIDOMA PROTEINS BIND DEXTRAN DIFFER FROM THAT SHOWN AT 1-7 POSITIONS,
WHICH OCCUR IN THE D AND J SECMENTS.

-i- MISCELLANEOUS: THIS PROTEIN BINDS DEXTRAN.
-i- SIMILDARITY: Contains 1 immunoglobulin-like domain.

                                                     hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. This sequence represents the human antibody VIII antibody clone EL-14 protein which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide, polypeptide and antibody useful for diagnosing the presence of neutralizing antibodies against factor VIII and for treatment of hemophilia A patients with these antibodies -
                                                                                                                                                                                                                                                                                                                         This invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. This sequence represents the human anti-factor VIII antibody VH EL-14 protein CDR3 fragment which is used in the method of the invention.

CC polypeptide (II) sequences. (I) is useful as hybridisation probes,
CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome
CC and gene mapping, and in recombinant production of (II). The
CC polymclectides are also used in diagnostics as expressed sequence tags
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
CC afford supplement. (II) and its binding partners are useful in medical
CC disorders involving aberrant protein expression or biological activity.
CC disorders involving aberrant protein expression or biological activity.
CC disorders for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. ABG00010-ABG30377 represent novel human
CC diagnostic amino acid sequences of the invention.
CC Mote: The sequence data for this patent did not appear in the printed
CC at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 3

                                                           pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

C. P. acnes is also involved in infections of bone, joints and the central conervous system, however it is particularly involved in the inflammatory constituents associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a condition of the inflammatory conditions associated with a binding agent that binds to the proteins of the invention conditions agent that binds to the proteins of the invention conditions agent that binds to the proteins of the invention conditions agent that binds to the proteins of the invention conditions agent that binds to the proteins of the invention conditions agent that binds in the sample. The conditions are not polypeptides may be used as antigens in the production of antibodies conditions agents for ferming P. acnes polypeptides and conditions. The antibodies may also be used as conditions agents for determining P. acnes presence, for example, by conditions the square data for this patent did not form part of the printed conditions, but was obtained in electronic format directly from WIPO conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   á

Sequences ABB31028-ABB35561 represent 4534 novel human proteins CC designated ORF (open reading frame) 1-4534, and sequences ABN75054-CC ABN75887 represent cDNAs encoding them. The invention also encompasses CC polypeptides at least 80% identical to the ORF1-ORF4534 (collectively collectively collectively proteins, proteins, polynucleotides at least 85% identical to the ORF1-ORF4534 (collectively collectively  And methods of screening for modulators of ORFX expression or collectively, and methods of screening individuals for a predisposition to an CC collectively collectively. The order collectively collectively collectively collectively. CC chemokinetic activity, haemostatic activity, thmoust inhibition activity, the collectively. CC collectively collectively, and may also be involved in the determination of boddily characteristics, fertility and behaviour. ORFX proteins,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABP57025
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC genes themselves and the encoded proteins. The prokaryotes used are CE Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen CC programmes. The antisense nucleic acid sequence for also useful to screen CC awide variety of organisms. The present sequence represents an CC awide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.
CC Note: The sequence data for this patent did not form part CC format directly from WIDO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The present invention describes a method (M1) of evaluating the potential of a chemical entity (CE) to associate with a molecule or molecular complex comprising a binding pocket (BP) defined by specific structural coordinates (SC) of D-Ala-D-Ala ligase (I) E. coli amino acids Lys144, Glu180, Lys181, Leu183, Glu187, Asp257 and Glu270, by employing a computational unit to perform a fitting operation between CE and BP defined by SC and analysing the results of the fitting operation to
                                                                                                                                                                                             Evaluating association binding pocket defined computational unit for
                                                                                                                                                                                                                                                                                                  Navia MA,

           The present invention describes a method (M1) of evaluating the potential of a chemical entity (CE) to associate with a molecule or molecular complex comprising a binding pocket (BP) defined by specific structural coordinates (SC) of D-Ala-D-Ala ligase (I) E. coli amino acids Lys144, Glu80, Lys81, Leu183, Glu87, Asp257 and Glu270, by employing a computational unit to perform a fitting operation between CE and BP defined by SC and analysing the results of the fitting operation to quantify the association between CE and BP. Also described is a method (M2) for identifying a potential inhibitor of (I). M1 is useful for evaluating the potential of a chemical entity to associate with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            quantify the association between CE and BP. Also described is a method (M2) for identifying a potential inhibitor of (I). M1 is useful for evaluating the potential of a chemical entity to associate with a molecule or molecular complex comprising a binding pocket. M2 is useful for identifying a potential inhibitor of D-Ala-D-Ala ligase. The methods are useful in the identification of key interaction in the active site of the enzyme, as well as the design and optimisation of inhibitors. The methods are also useful in the drug discovery methods, particularly for discovering new drugs that inhibit D-Ala-D-Ala ligase, an essential enzyme in the formation of bacterial cell walls. The present sequence represents a D-Ala-D-Ala ligase amino acid sequence given in an example
                                                                                                                                                                                                                                                                                                                   Magee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               D-Ala-D-Ala ligase;
                                                                                                                                                                                                                            Evaluating association binding pocket defined computational unit for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein

The methods are useful in the identification of key interaction in the active site of the enzyme, as well as the design and optimisation of inhibitors. The methods are also useful in the drug discovery methods, particularly for discovering new drugs that inhibit D-Ala-D-Ala ligase, an essential enzyme in the formation of bacterial cell walls. The present sequence represents a D-Ala-D-Ala ligase amino acid sequence given in an example
                                                                                                                                         neurodegenerative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                        disorders, and
                                                                                                                                                            New isolated polypeptides and polynucleotides, useful for preventing, treating or ameliorating medical conditions, such as cancer,

encode. The polynucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, medical imaging, identification of mutations responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or ameliorating medical conditions, such as cancer, neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell disorders, osteoporosis, osteoarthritis, bone

The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics,

degenerative disorders,

periodontal

disease,

fibrosis,

infections

                                                                                           The present sequence represents rat TAO2 protein kinase, which is capable of phosphorylating MEK3 (a MAP/ERK kinase). TAO kinases, and related polypeptides, are used to screen for modulators of stress-responsive mitogen activated protein (MAP) kinase pathways. These modulators are completed for treating or preventing: (1) inflammation, completed for completed for completed for cancer and degeneration (inhibitors of phosphorylation); or (2) insulin-resistant diabetes, metabolic disorders can meurodegeneration (enhancers of phosphorylation). TAO kinases are modulators and as immunoassay reagents for detecting TAO kinases, and (b) in the form of fragments, for detecting TAO kinase polynucleotides can be used: (a) for recombinant expression completed for the form of fragments, for detecting TAO completed for the form of fragments. Table completed for the form of fragments for detecting TAO completed for the form of fragments. Table completed for the form of fragments for detecting TAO completed for the form of fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

The present invention relates to the isolation of novel human enzyme CC polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences concerning them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolasses, lyases, CC diagnosis, treatment, prevention and/or prognosis of a wide range of the invention are useful in the CC disorders including hyperproliferative disorders (e.g. cancer), CC (e.g. arthritis), neurological disorders (e.g. Alzaelarer's disorders (e.g. arthritis), neurological disorders (e.g. Alzaelarer's disorders (e.g. asthma), cardiovascular disorders (e.g. atheroscience), CC (e.g. asthma), cardiovascular disorders (e.g. atheroscience), CC (e.g. asthma), cardiovascular disorders (e.g. atheroscience), CC (e.g. infertility) and infectious disorders (e.g. Inflammatory disorders (e.g. infertility) and infectious disorders (e.g. Inflammatory disorders (e.g. infertility) and infectious disorders (e.g. Inflammatory disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The CC (aANZ22915-AANZ23814 represent the novel human enzyme polypeptides of the
                                                                    invention.

                                                                                                                                                                                                                                      XXXX
                                                                                                                   밁
                                                                                                                                            á
                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II) The polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quannitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have spplications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.
                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and CC polymerpide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating a followed and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations amino acid sequences of data and products dependent on DNA and CC and to produce other types of data and products dependent on DNA and CC diagnostic mino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO XXX
                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                          CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC continuities are also used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques (II). (III) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human acid sequences data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO cat furnition int/pub/published not sequences.

                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 20; SEQ ID No 34405; 103pp; English.

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC converted that is a sequence to polymucleotides are also used in diagnostics as expressed sequence tags (CC ii). (II) is useful in gene therapy techniques (CC ii). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC imaging of sites expressing (II). (I) and (II) are useful in medical clisorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content of the sequence of the invention.

D15R protein - variola minor virus (strain Garcia-1966)
C;Species: variola minor virus
C;Bate: 24-Nov-1999 #sequence_revision 24-Nov-1999 #text_change 24-Nov-1999
C;Accession: B72175
R;Shchelkunov, S.N.; Totmenin, A.V.; Gutorov, V.V.; Safronov, P.F.; Massung, submitted to GenBank, March 1998
A;Bescription: Analysis of the complete coding sequence of DNA of alastrim vA;Reference number: A72150
A;Accession: B72175
A;Accession: B72175
                                                                                                                                        A; Notecube type: DNA
A; Molecule type: DNA
A; Residues: 1-1896 <SHC>
A; Cross-references: GB:Y16780; NID:g5830555; PIDN:CAB54796.1; PID:e1542752;
